

# Relative humidity at temperatures up to 180 °C and pressures up to 600 kPa

R. Bosma, A. Peruzzi and J. van Geel

- ✓ Humidity at high temperatures
- ✓ Modifications of the facility since 2013
- ✓ Validation at pressure
- ✓ Drift and pressure sensitivity of thermistors
- ✓ Future work : dew-point temperatures above 95 °C

# Humidity at high temperature

Drying is estimated to cost European industry around 30 000 M€ per year in associated energy costs. Every 0.1 % improvement in drying efficiency due to better process control could save around 30 M€/year. Monitoring humidity under transient conditions and at temperatures above 100 °C is a key factor in controlling drying processes. Thus, by improving the reliability of these humidity measurements annual savings of millions of euros can be achieved in Europe

Wood drying

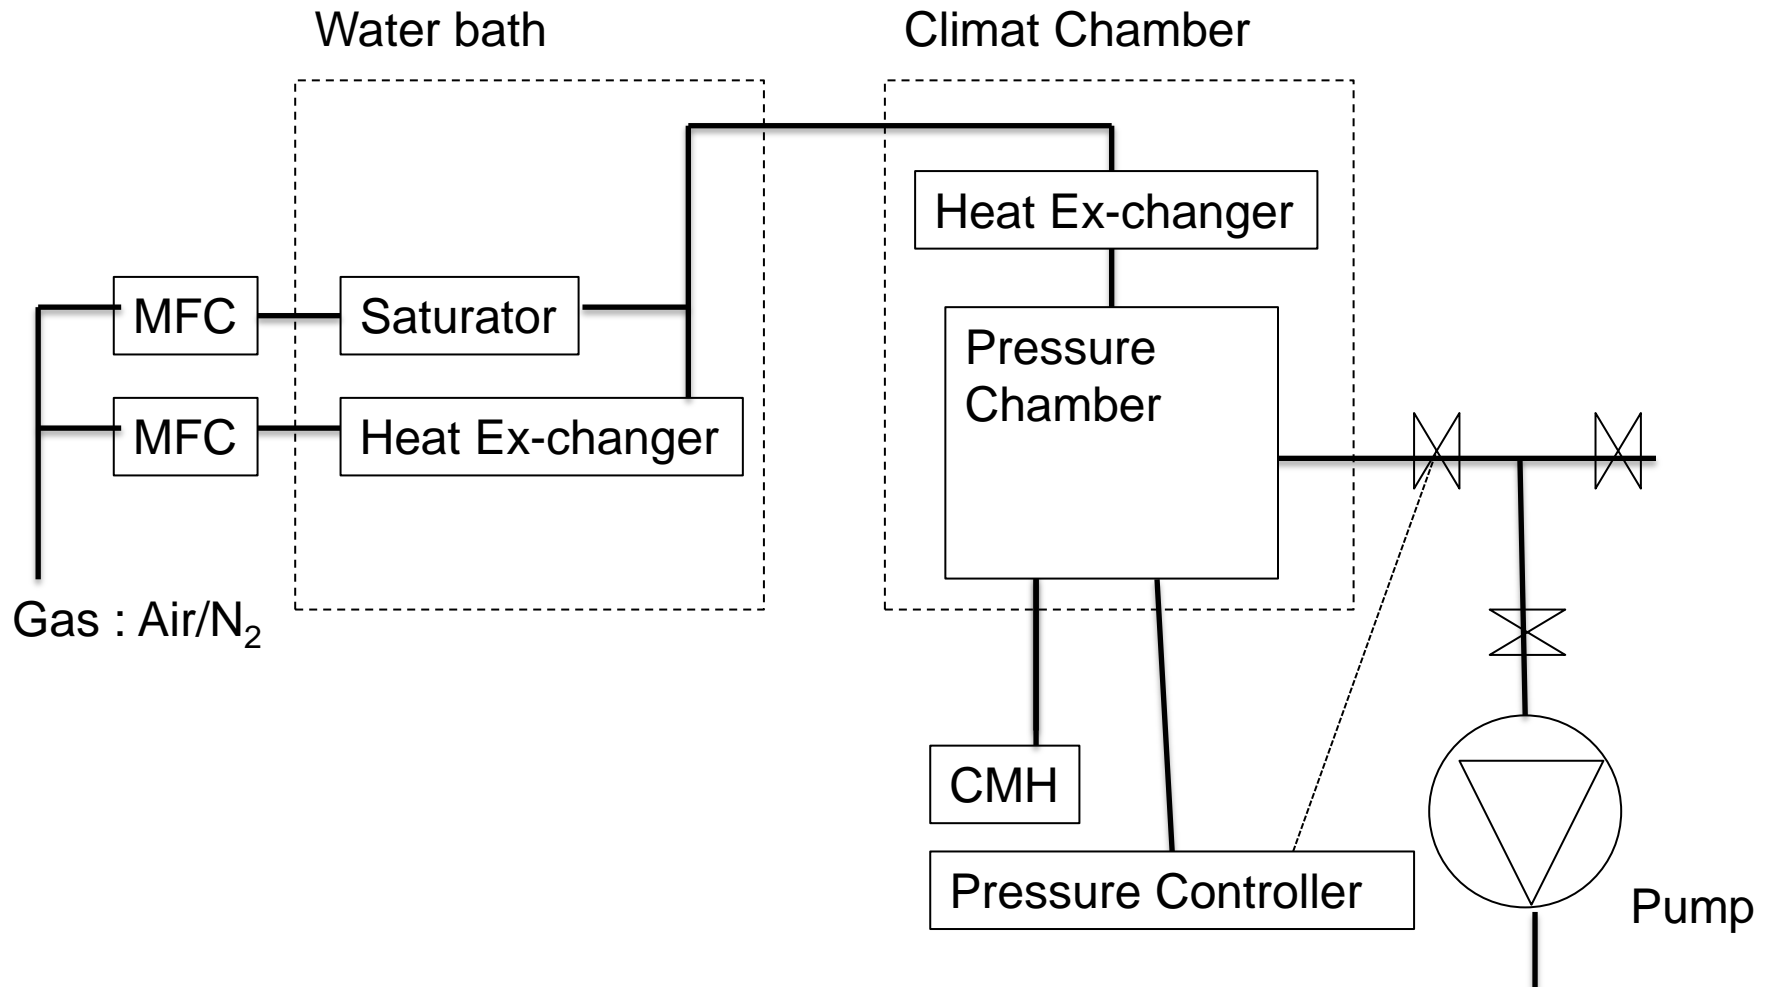

Paper drying (1970's)

Spray-dryer: Milk powder, Pharmaceutical products, Ceramics, etc

# Design facility

# Design Chamber in Chamber

Specifications Chamber 2011:

- ❑ Fits inside HC 4033 Chamber
- ❑ Range -40 °C to 180 °C
- ❑ Corrosion resistant (high humidity at high temperature)
- ❑ Leak tight
- ❑ Pressure up to 600 kPa

# Realization in 2011

# Modification of saturator

Glass cylinder for use at atmospheric pressure; water level 28 cm

2013

Steel container for use up to 600 kPa (Pre-Sat of HTS); water level 28 cm

2014

Two steel container for use up to 600 kPa; water level 50 cm.

$\eta > 97 \%$  at  $20 \text{ l} \cdot \text{min}^{-1}$

Saturator in water bath → temperature up to 95 °C

# Modification $Q_v/P$ -Control

Rota-meters and  
home-built valve  
control

2014

Mass flow controllers and  
commercial pressure  
controller

# Validation of pressure range

Validated from -40 °C to 180 °C, 1 %rh to 98 %rh and 70 kPa to 500 kPa

# Validation Humidity

Optidew in door of chamber

373 HX via sample tube outside chamber

No influence of pressure on difference between CMH's

# Validation Temperature

- HMT337 in door of chamber
- 6 thermistors in chamber

No influence of pressure on difference between temperatures

# Validation Uniformity

➤ 6 thermistors in chamber

No influence of pressure on uncertainty component for temperature uniformity

# Drift of thermistors (1)

- 7 calibrations between September 2011 and July 2015
- $u(\text{cal})$  between 6 mK and 7 mK ( $N=5$ )
- Differences increase at low temperature (high resistance)

# Drift of thermistors (2)

- 7 calibrations between September 2011 and July 2015
- $u(\text{cal})$  between 6 mK and 12 mK (N=5)
- Differences increase at low temperature (high resistance)

# Pressure dependence thermistor (1)

- 2 thermistors sealed in tube and submerged in water bath
- Function  $t = f(R)$  measured at 100 kPa
- $R_{UUT,i}, p_{UUT,i}$  measured with air in tube pressurized up to 1 MPa

# Pressure dependence thermistor (2)

- Pressure sensitivity measured at 25 °C, 50 °C and 75 °C
- Uncertainty in temperature  $u(t) = 2.5$  mK
- Up to 600 kPa no pressure sensitivity detectable

# Preliminary work on $t_d > 95\text{ }^{\circ}\text{C}$

- Coriolis mass flow controller up to  $10\text{ ml}\cdot\text{min}^{-1}$
- 11 litre water container pressurized to 1 MPa
- Different ways of injecting water in dry gas tested
  - ☐ injecting direct in the dry gas stream
  - ☐ pre-heat the water before injecting
  - ☐ using small saturator (horizontal/vertical)

# Results direct water injection

➤ Simple principle

➤ Achieved  $t_d = 130$  °C

➤ Large effect on pressure chamber temperature

# Results saturator

- Less simple principle
- More stable dew-point temperature
- Still large effect on temperature

# Conclusion

- Pressurizing the chamber does not affect the performance of the facility
- Thermistors can be used at high temperature and humidity with small drift
- Thermistors can be used up to 600 kPa without additional uncertainty
